

# CONTINUOUS SECURITY: INTEGRATE SECURITY INTO YOUR DEVOPS PIPELINES

### **BILL DINGER**

Solutions Architect | @adazlian bill.dinger@vml.com https://github.com/BillDinger/ContinuousSecurity

### SECURITY LAPSES RUIN CUSTOMERS TRUST IN YOU

I am rugged and, more importantly, my code is rugged.

I recognize that software has become a foundation of our modern world.

I recognize the awesome responsibility that comes with this foundational role.

I recognize that my code will be used in ways I cannot anticipate, in ways it was not designed, and for longer than it was ever intended.

I recognize that my code will be attacked by talented and persistent adversaries who threaten our physical, economic, and national security.

I recognize these things - and I choose to be rugged.

I am rugged because I refuse to be a source of vulnerability or weakness.

I am rugged because I assure my code will support its mission.

I am rugged because my code can face these challenges and persist in spite of them.

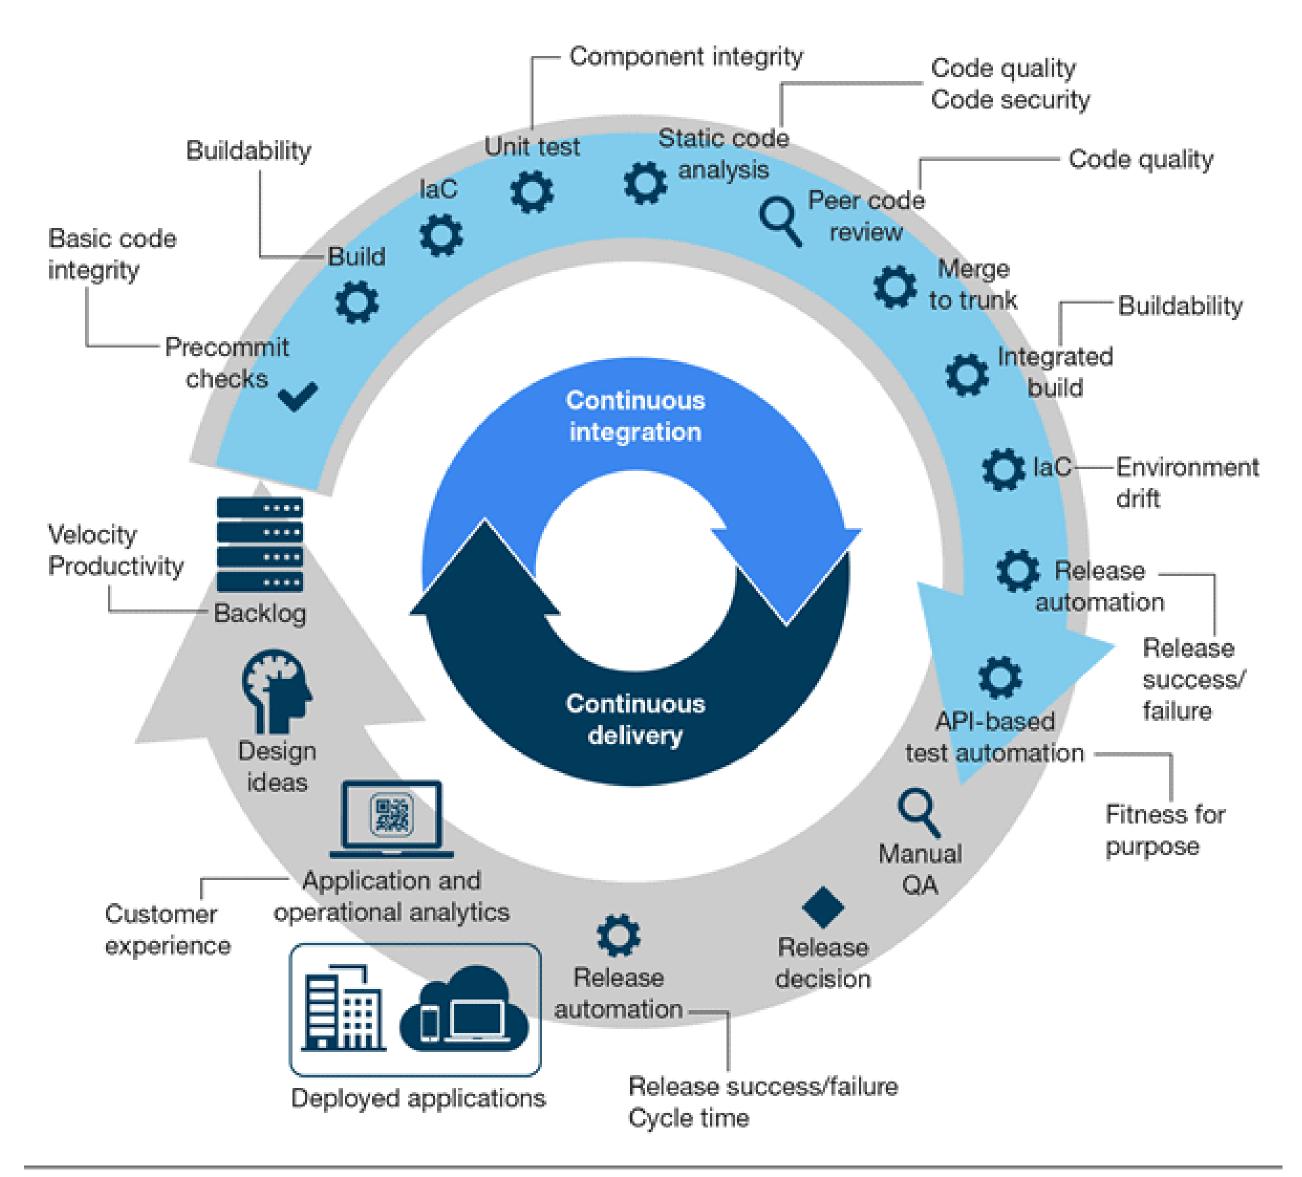

I am rugged, not because it is easy, but because it is necessary and I am up for the challenge.

### SHIFT LEFT: TEST EARLY & TEST OFTEN

"Another finding in our research is that teams that build security into their work also do better at continuous delivery [...] When the tools provided actually make life easier for the engineers who use them, they will adopt them of their own free will."

"We found that high performers were spending 50% less time remediating security issues than low performers. In other words, by building security into their daily work, as opposed to retrofitting security concerns at the end, they spent significantly less time addressing security issues."

### BRIDGING THE GAP

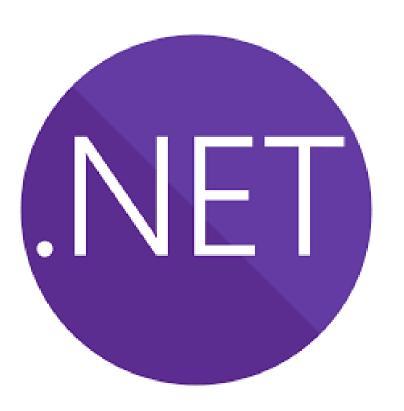

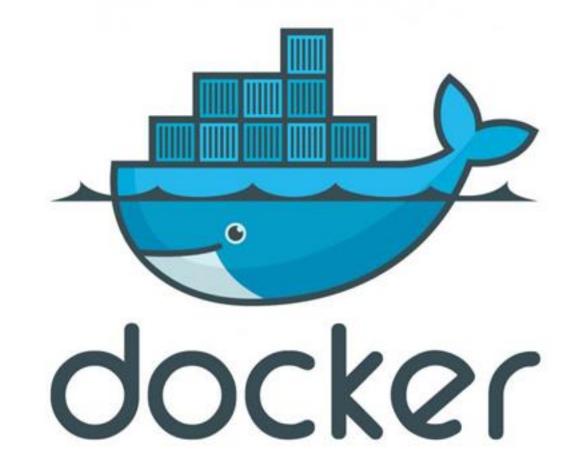

### WHAT IS OWASP?

- Open Web Application Security Project a 501(c)(3) focused on developing and improving the security of software
- Formed in 2001, its core purpose is to "Be the thriving global community that drives visibility and evolution in the safety and security of the world's software"
- Provides numerous resources besides the OWASP Top 10, including personal favorites such as the Cheat Sheet Series, SAMM Project and Zap Attack Proxy Project

### OUR TOOLS

Code: Dependency Check Zed Attack proxy (ZAP) Open Web Testing Framework (OWTF) Web Testing Environments (WTE) Sonarqube Rules Documentation: **Application Security Verification Standard** 

### OWASP DEPENDENCY CHECK

### OWASP DEPENDENCY CHECK

#### **Benefits**

Protects against the OWASP #9 – using components with known security vulnerabilities automatically as part of your build and CI pipeline.

#### **How it works**

Scans dependencies and compares them against the NIST National Vulnerability Database (NVD) for any posted CVEs. Supports suppression lists, report generation, failure depending on severity, etc.

#### **Implementations**

- Java & .NET are officially supported.
- Python, Ruby, PHP, Node.JS, C/C++ experimental support.
- Command Line/Jenkins/Gradle/Maven/Ant plugins and tooling all exist in various forms of maturity.

Java (Maven)

mvn dependency-check:check

```
<plugin>
 <groupId>org.owasp</groupId>
 <artifactId>dependency-check-maven</artifactId>
 <version>3.3.2
  <configuration>
   <cveValidForHours>24</cveValidForHours>
   <failBuildOnCVSS>4</failBuildOnCVSS>
   <format>XML</format>
   <suppressionFile>suppression.xml</suppressionFile>
  </configuration>
  <executions>
    <execution>
     <goals>
       <goal>aggregate</goal>
     </goals>
     <phase>package</phase>
   </execution>
  </executions>
</plugin>
```

```
Central analyzer disabled
      Checking for updates
      Skipping NVD check since last check was within 24 hours.
      Skipping RetireJS update since last update was within 24 hours.
      Check for updates complete (24 ms)
      Analysis Started
      Finished Archive Analyzer (1 seconds)
      Finished File Name Analyzer (0 seconds)
      Finished Jar Analyzer (0 seconds)
      Finished Dependency Merging Analyzer (0 seconds)
      Finished Version Filter Analyzer (0 seconds)
   FO] Finished Hint Analyzer (0 seconds)
      Created CPE Index (1 seconds)
      Skipping CPE Analysis for npm
  FO] Finished CPE Analyzer (1 seconds)
      Finished False Positive Analyzer (0 seconds)
      Finished NVD CVE Analyzer (0 seconds)
      Finished Vulnerability Suppression Analyzer (0 seconds)
      Finished Dependency Bundling Analyzer (0 seconds)
[INFO] Analysis Complete (3 seconds)
```

Command Line

```
D:\_Code\BikeShop\dependency-check\bin>dependency-check -s ..\**\*.dll --project BikeShop
```

### MSBuild Task

https://jeremylong.github.io/DependencyCheck/dependency-check-cli/arguments.html

### PHP

C:\\_code\talks\ContinuousSecurity\cli\bin>dependency-check.bat --project test --out c:\\_code\talks\ContinuousSecurity --scan c:\\_Code\talks\ContinuousSecurity\php -l c:\\_code\talks\ContinuousSecurity\out.log --enableExperimental

- enableExperimental required as PHP is considered an 'experimental' analyer
- -l outputs a verbose log file for debugging.
- --scan point to location of your compose & composer-lock file
- --out is where the HTML report is outputted.

https://jeremylong.github.io/DependencyCheck/dependency-check-cli/arguments.html

### Jenkins Integration

#### **DependencyCheck Result**

#### **Warnings Trend**

All Warnings	New Warnings	Fixed Warnings
153	138	0

#### **Summary**

Total	High Priority	Normal Priority	Low Priority
153	<u>24</u>	111	18

#### Details

Category	Total	Distribution
CWE-119 Improper Restriction of Operations within the Bounds of a Memory Buffer		
CWE-134 Uncontrolled Format String		
CWE-189 Numeric Errors		
CWE-20 Improper Input Validation	7	
CWE-200 Information Exposure	5	
CWE-22 Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')		
CWE-264 Permissions, Privileges, and Access Controls		
CWE-287 Improper Authentication		
CWE-310 Cryptographic Issues		
CWE-399 Resource Management Errors		
CWE-59 Improper Link Resolution Before File Access ('Link Following')	4	
CWE-79 Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	14	
CWE-89 Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	2	
CWE-94 Improper Control of Generation of Code ('Code Injection')	10	
Total	153	

#### 0 vulnerabilities.

- No warnings since build 619.
- New zero warnings highscore: no warnings for 4 days!

```
configure { project ->

### OWASP SONARQUBE RULES

### OWASP SONARQUBE RULES

#### **Benefits**

A number of "suggested" rulesets to add to your static code analysis to catch common security issues before they can ever be merged in.

#### **How it works**

Integrates into Sonarqube natively as a ruleset. Performs static code analysis to see if the code violates any of the rules and flags as necessary. If running SonarQube as part of your build pipeline (and if you aren't...) it'll raise violations as critical allowing you to fail builds or fail merge checks.

### **Implementations**

- Java/Groovy
- Sonarqube itself ships with a number of rulesets for Javascript/Typescript/Ruby/Python/PHP/Swift/C#/etc

### SONARQUBE RULES IN ACTION

### Quality Gates, in line reporting, corrective action

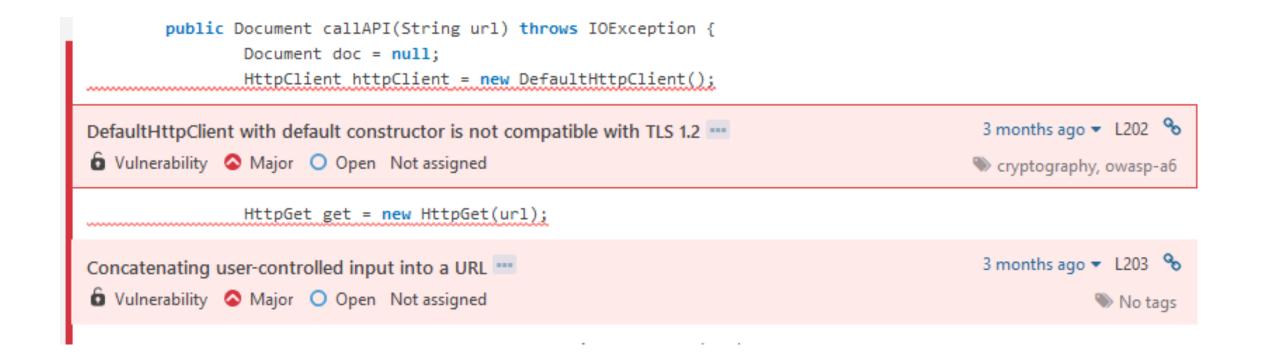

#### Conditions

Only project measures are checked against thresholds. Sub-projects, directories and files are ignored. More

Metric	Over Leak Period	Operator	Warning	Error
Bugs	No	is greater than	0	5
Security Rating	Never	is worse than	Α	В
Vulnerabilities	No	is greater than	0	0

#### Projects

Every project not specifically associated to a quality gate will be associated to this one by default.

SonarQube analysis reported 15 issues

- 0 1 critical
- 😃 14 minor

Watch the comments in this conversation to review them.

### ZAP ATTACK PROXY

### ZAP ATTACK PROXY

#### **Benefits**

Automatically hits your site/server probing for vulnerabilities.

#### **How it works**

Scans your machine with a configurable set of rules looking for common vulnerabilities and outputs a report. Looks for all the common OWASP top 10 violations as well as misconfigured machines, etc.

### **Implementations**

Has a large, customizable rule set as well as integration points with Jenkins and prebuilt docker images as well as an official Jenkins plugin.

### ZAP OPTIONS

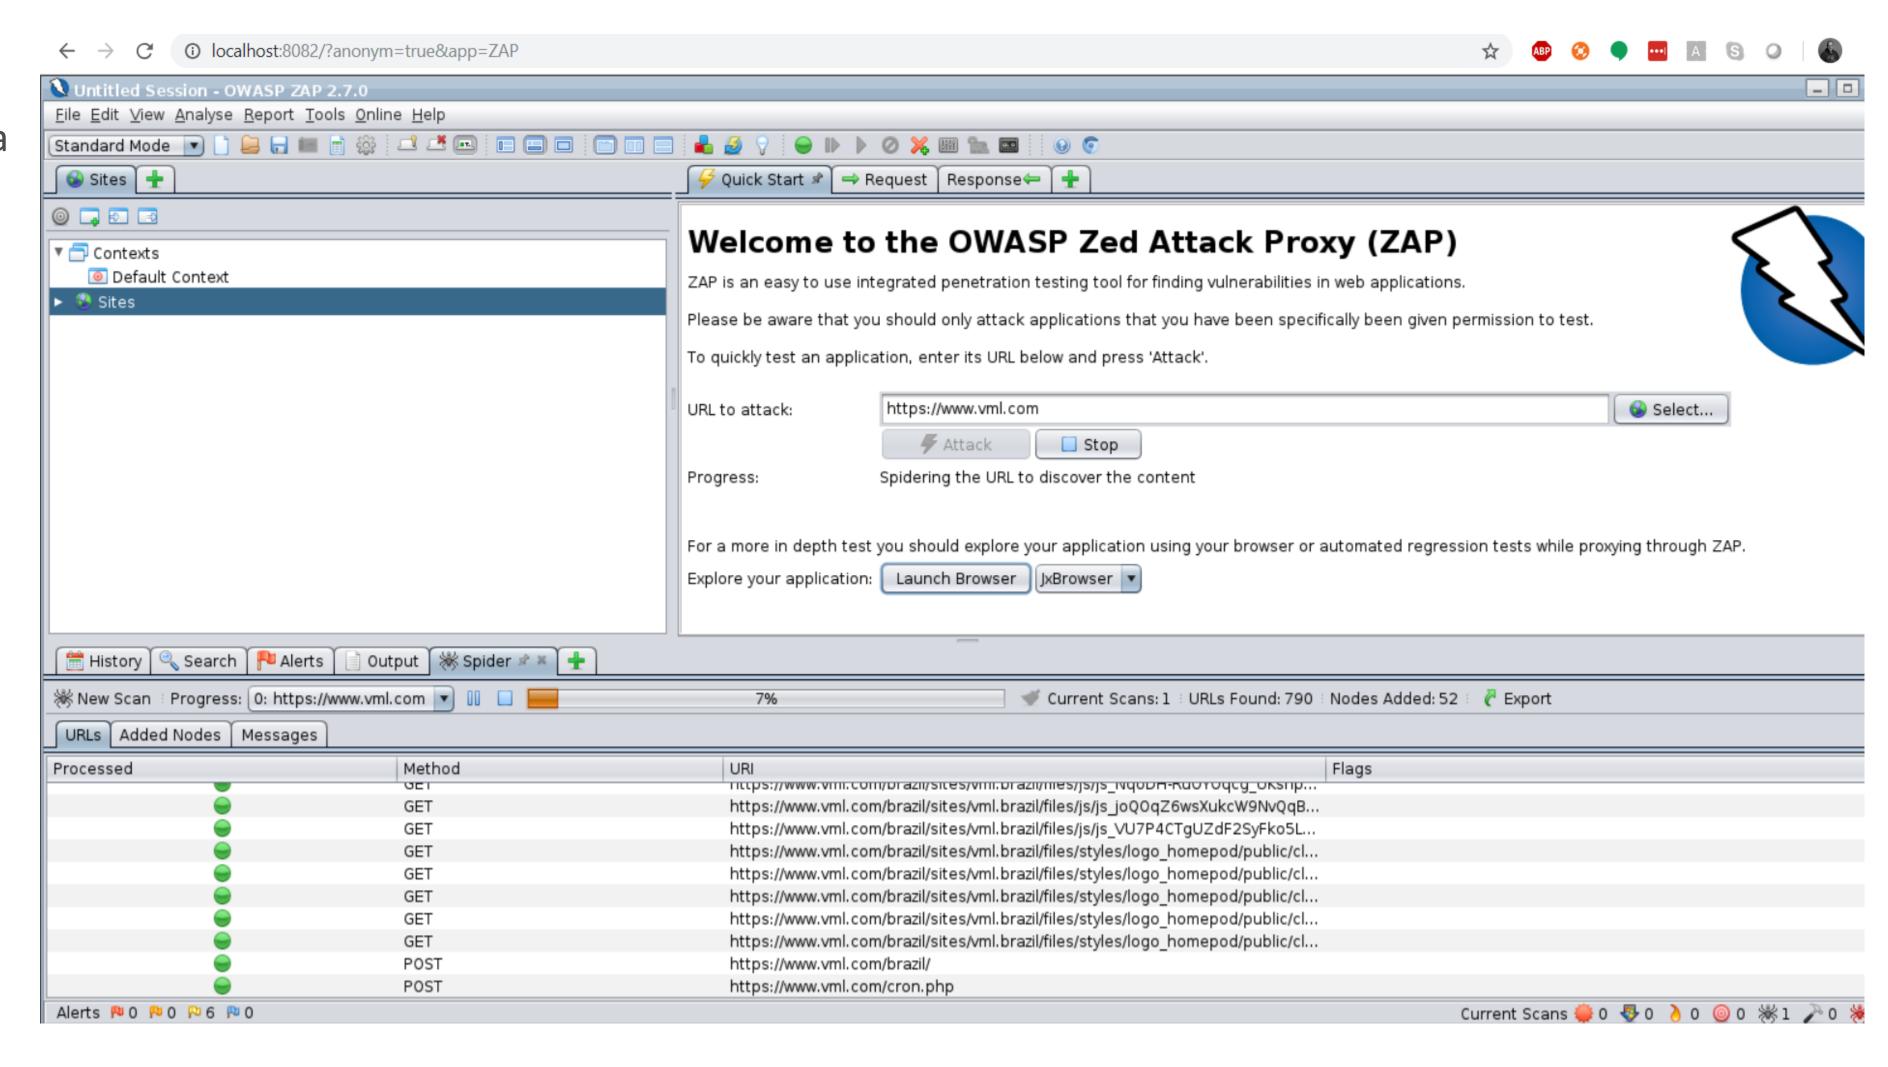

GUI – Java based, uses SWING CLI – Command line interface REST - API Jenkins Plugin

### ZAP IN ACTION

#### **GUI**

There is a GUI available to run a "traditional" scan but this Isn't very scriptable.

Great for exploratory testing and figuring out your options.

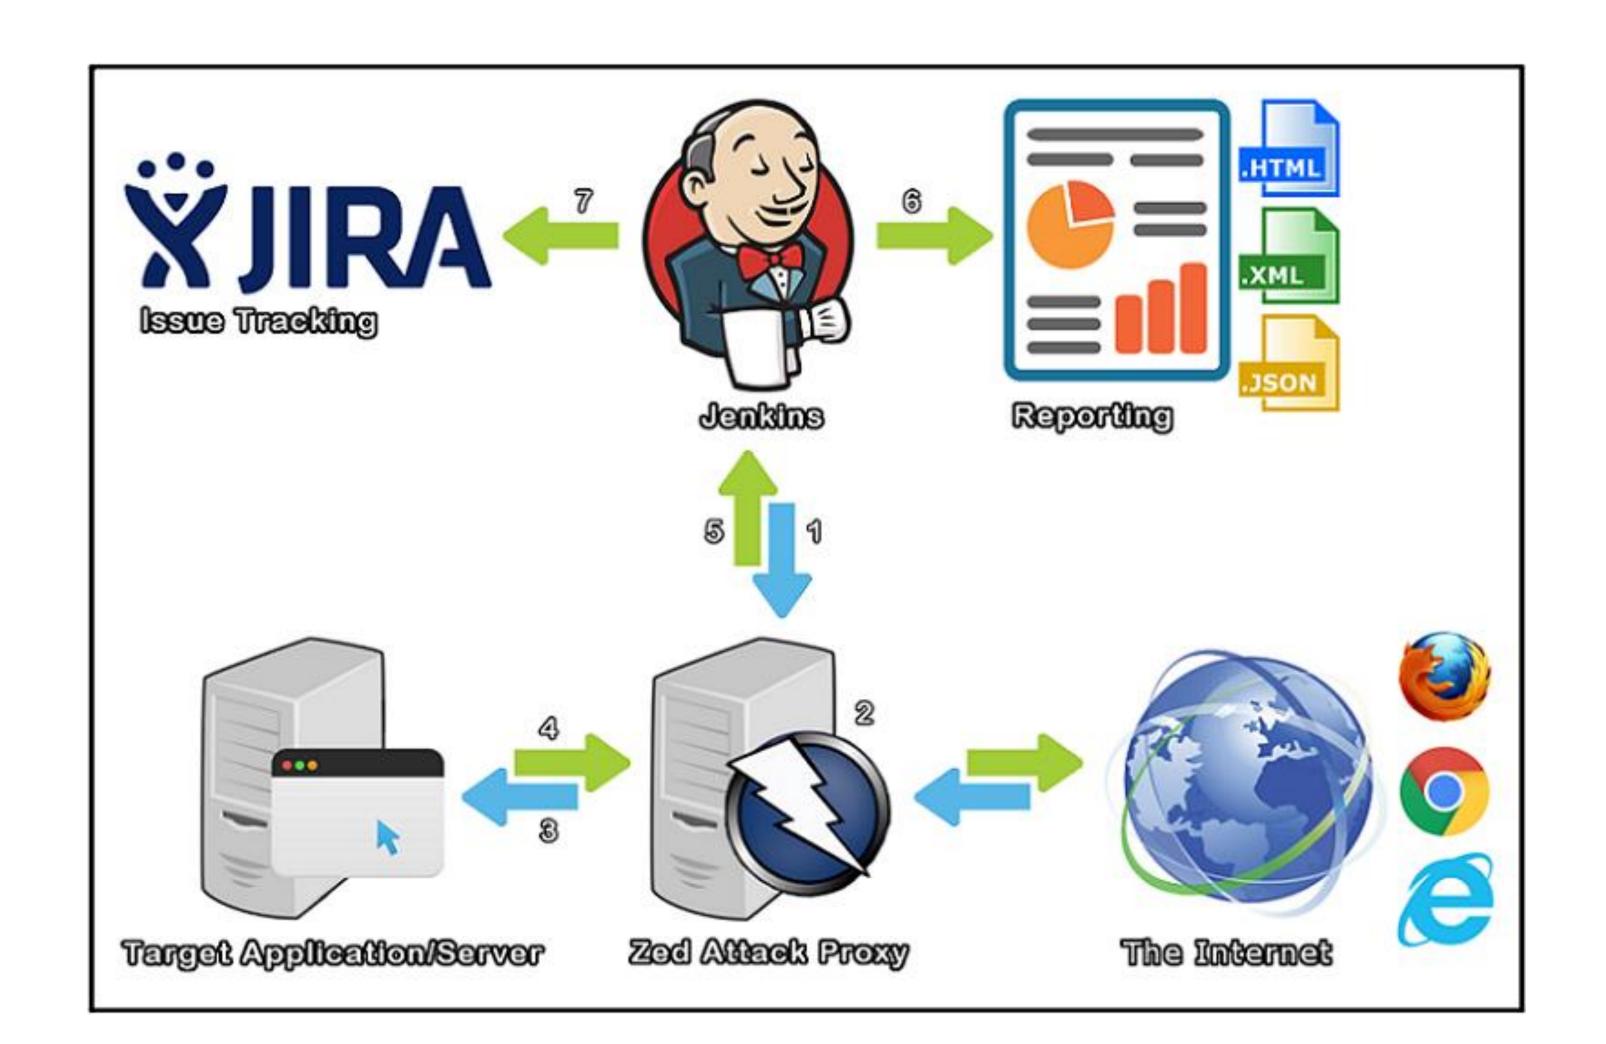

### ZAP IN ACTION: JENKINS PLUGIN

Also an official Jenkins plugin.

Has Integration with JIRA.

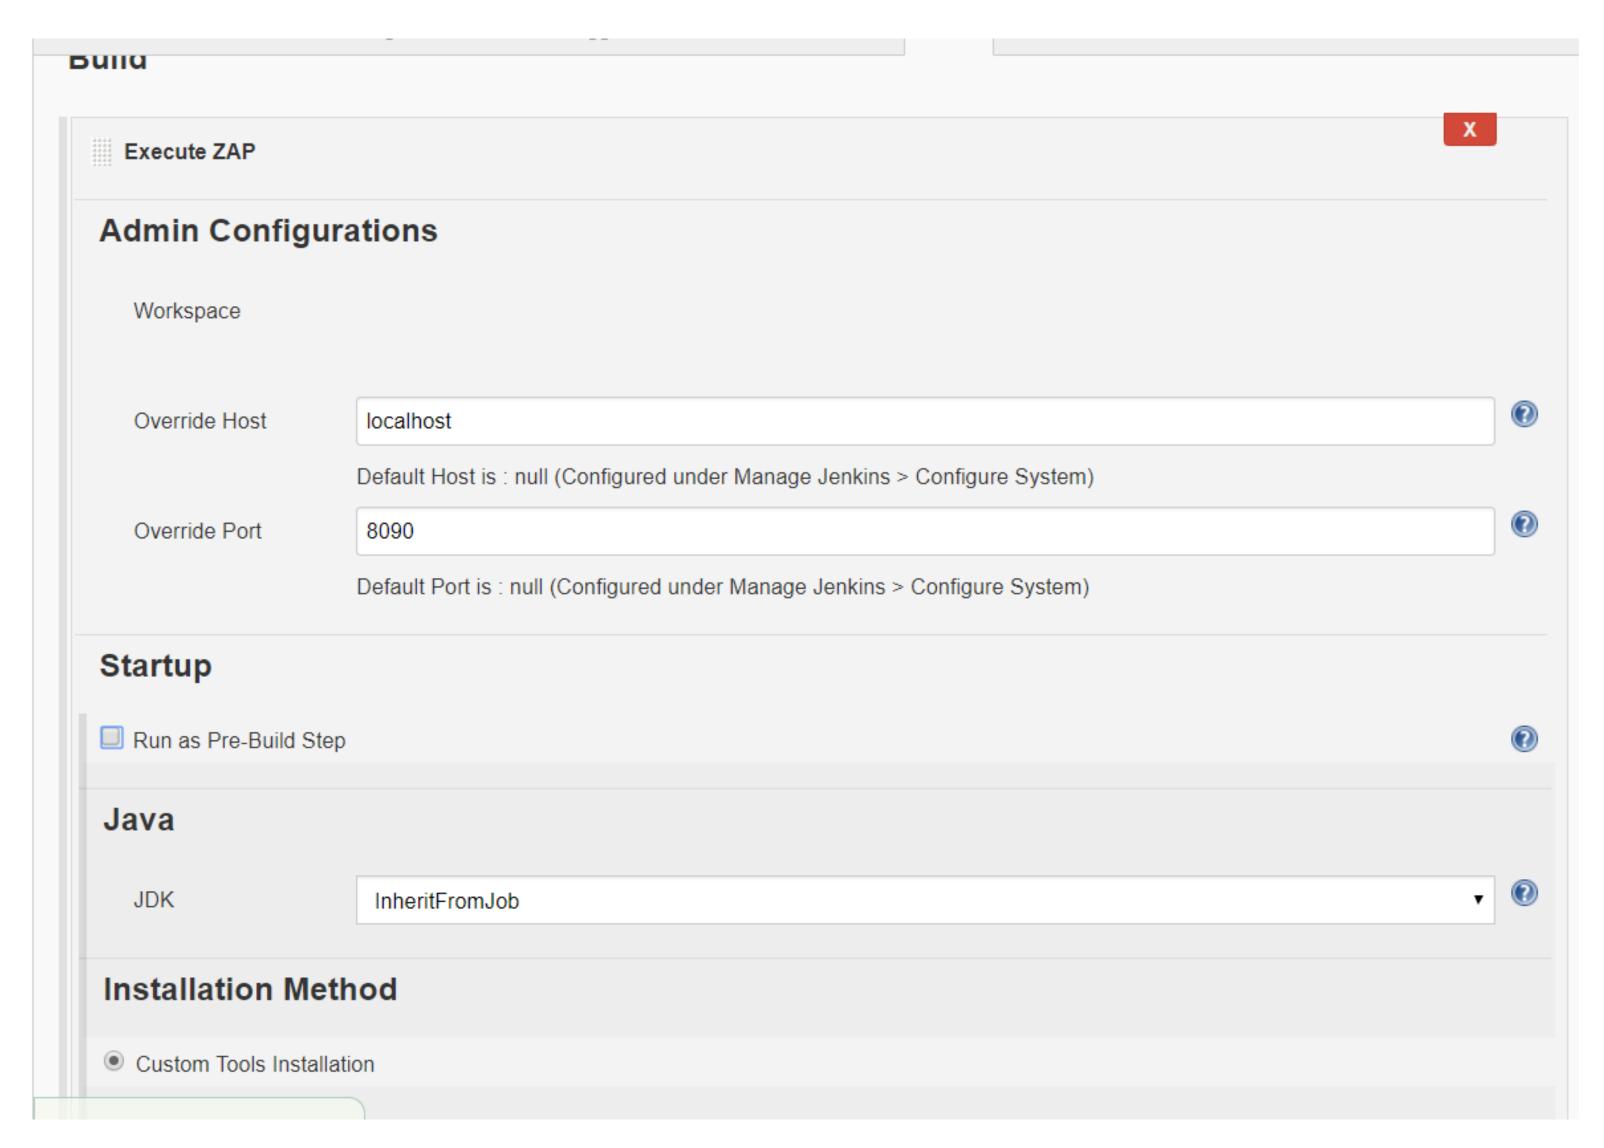

Requires full install of OWASP ZAP.

### ZAP IN ACTION: JENKINS PLUGIN

#### **Drawbacks**

Great integration, but requires owasp zap server to be running on same container as Jenkins OR have Jenkins slave installed on your owasp container.

### ZAP IN ACTION: ZAP CLI

[INFO]

Shutting down ZAP daemon

#### **Quick Scan**

Runs a very basic scan, limited to one minute

#### Baseline

Completely safe, usually very quick.

#### **Active Scan**

Not safe, potentially legal / production impacting.

C:\Users\bdinger>docker run -i owasp/zap2docker-stable zap-cli quick-scan --self-contained --start-options "-config api. disablekey=true" http://owasp.localdev.com [INFO] Starting ZAP daemon [INFO] Running a quick scan for http://owasp.localdev.com [INFO] Issues found: 0

### ZAP IN ACTION: ZAP-API

#### **Invoke VIA API**

ZAP api provides a rich feature set.

Best use case is in docker container setups.

Suggestion is to chain to your Jenkins instance and invoke

### ZED ATTACK PROXY: TIPS

#### Run as the last stage of your pipeline

ZAP requires that the code actually be running before it can be tested like automated QA tests.

#### Or as a schedule task

In case the complexity of a build being deployed, then being failed back, is too risky for your environment you can instead run it on a set schedule and use the results of that to inform deployment decisions.

#### **Lots of Resources**

Zap consumes major resources running and will easily bring a machine to its knees. Provision it well and (suggested) to use a docker container and scale/destroy as needed. Don't run it on same box as your Jenkins machine!

### ZAP SCAN INFRASTRUCTURE OPTIONS

#### Run in a separate container

Build as a separate docker container invoked in parallel with you build.

#### Run in same container

Assuming you build containers and deploy them to your infrastructure, can build the containers with the OWASP tool and run against container.

### Run in jenkins

As mentioned, can run in the same box as Jenkins but will require a lot of resources.

### OPEN WEB TESTING FRAMEWORK

### OPEN WEB TESTING FRAMEWORK

#### **Benefits**

An active pen testers framework.

#### **How it works**

Provides a prebuilt environment with a number of configurable plugins. Designed to help your active penetration testers run their security tests against your site. Note this differs from ZAP (Zed Attack Proxy) which is *solely* an automated attack proxy.

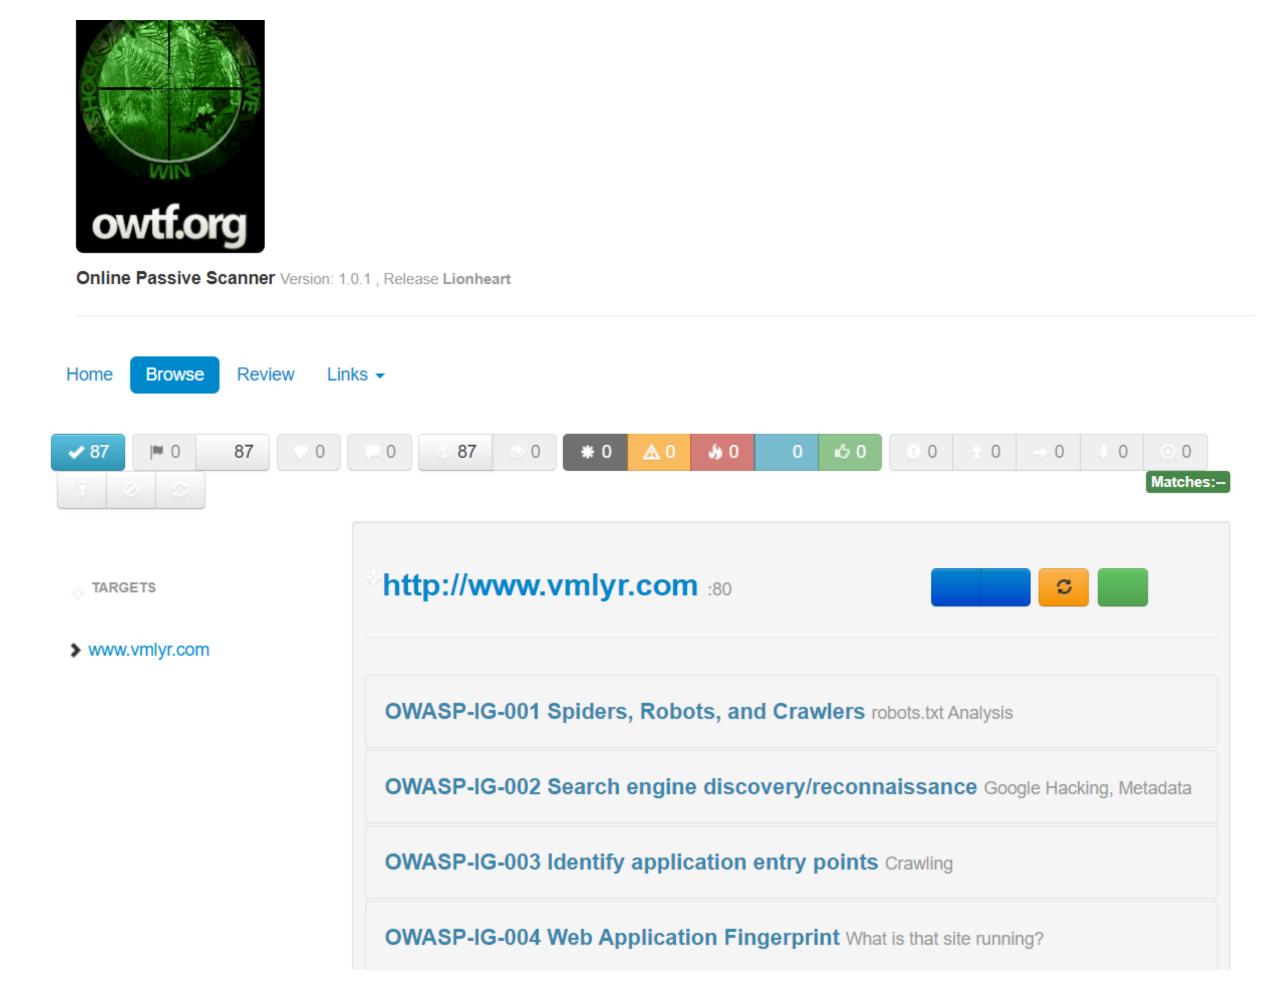

### **Implementations**

Currently implemented and distributed as alive cd/ docker image / homebrew package

### OWTF: IN ACTION

**Online Test Environment:** 

https://owtf.github.io/online-passive-scanner/

### WEB TESTING ENVIRONMENTS

### WEB TESTING ENVIRONMENT

#### **Benefits**

A prebuilt image (or series of packages) with common AppSec tools built into them.

#### **How it works**

OWASP supplies a few images and packages with a number of popular security testing tools – like nmap – already built in. This allows you to grab a stock, standard prebuilt image that can be spun up and either further automated or simply handed off to your security testing team.

### **Implementations**

Besides Debian packages also includes Vmware, Virtuablebox and parallels images as well as a docker image (soon)

### WTE: IN ACTION

#### **Automated with run commands**

Stable docker image that can run nmap, etc script commands via docker or Jenkins.

### Spun up to evaluate environments

Start up and provision as part of pipeline to be handed off to penetration testing team

# APPLICATION SECURITY VERIFICATION STANDARDS

### ASVS

#### **Benefits**

A guidebook to securing your application stack.

#### **How it works**

A series of checklists and procedures covering the whole gamut of security to ensure you're critical infrastructure (like your devops pipelines) is fully secure.

### **Implementations**

Documentation available on OWASPs site

### ASVS EXAMPLE AUDIT

#	Description	1	2	3	Since
2.1	Verify all pages and resources by default require authentication except those specifically intended to be public (Principle of complete mediation).	1	~	1	1.0
2.2	Verify that all password fields do not echo the user's password when it is entered.	1	1	1	1.0
2.4	Verify all authentication controls are enforced on the server side.	1	1	1	1.0
2.6	Verify all authentication controls fail securely to ensure attackers cannot log in.	1	1	1	1.0
2.7	Verify password entry fields allow, or encourage, the use of passphrases, and do not prevent long passphrases/highly complex passwords being entered.	1	1	1	3.0
2.8	Verify all account identity authentication functions (such as update profile, forgot password, disabled / lost token, help desk or IVR) that might regain access to the account are at least as resistant to attack as the primary authentication mechanism.	1	/	1	2.0
2.9	Verify that the changing password functionality includes the old password, the new password, and a password confirmation.	1	1	1	1.0
2.12	Verify that all suspicious authentication decisions are logged. This should include requests with relevant metadata needed for security investigations.		1	1	2.0
2.13	Verify that account passwords make use of a sufficient strength encryption routine and that it withstands brute force attack against the encryption routine.		1	1	3.0
2.16	Verify that credentials are transported using a suitable encrypted link and that all pages/functions that require a user to enter credentials are done so using an encrypted link.	1	1	1	3.0

## REMEMBER: IF YOUR CI/CD STACK IS COMPROMISED YOU'VE LOST EFFECTIVE CONTROL OF ALL APPS
